

New Fontaine® TechLock® Sensor Fifth Wheel

- Improves driver safety while reducing the possibility of personal injury and property damage
- Two electronic sensors work together to let the driver know whether or not the kingpin is correctly positioned inside the locking mechanism
- When the sensors indicate a successful coupling a green light illuminates
- After coupling, the system continuously monitors the sensors and warns the driver with a red light if a change occurs
- Visual indicator gives drivers peace of mind when they return to a parked truck because they can easily see if someone tampered with the lock while they were away
- This advanced technology system supplements the driver's visual inspection and safety pull-test to virtually eliminate false trailer couplings
